The northern region of KwaZulu-Natal, South Africa, is characterized by semiarid shrublands and woodlands with an abundance of Acacia karroo. Numerous studies have focused on the effects of desiccation on the embryonic axes of this species. However, the influence of post-harvest treatments on seedling establishment has not been fully explored. This study investigated the effects of a variety of post-harvest treatments on the germination and establishment of Acacia karroo seeds.

INTRODUCTION

Keywords: Acacia karroo, post-harvest treatments, seedling establishment, KwaZulu-Natal

ABSTRACT

The present study aims to investigate the effects of post-harvest treatments on the germination and establishment of Acacia karroo seeds.
